Riverton University invites teams to design a practical improvement for a small community institution. The institution has limited money, uncertain demand, and a responsibility to serve residents fairly. Your proposal should identify one operational problem, explain why existing practices are inadequate, and recommend an intervention that can be tested within one academic term. State the assumptions behind your analysis and explain which observations would cause you to change your recommendation. Include a way to measure progress without collecting unnecessary personal information. Discuss an implementation risk, a possible unintended consequence, and a low cost method for gathering feedback. The evaluation panel values clear reasoning over ambitious technology. Teams may use simple schedules, physical tools, or public information where appropriate. Do not assume that additional staff, permanent subsidies, or expensive equipment will become available. Conclude by explaining how the institution could decide whether to continue, adapt, or stop the proposed pilot after review.

I would begin with the school's drinking water taps. A caretaker can place identical marked buckets under three taps for one minute before pupils arrive. Recording the collected volume twice a week would reveal whether sediment is restricting one branch of the pipe. Cleaning a removable filter is a smaller commitment than replacing the full plumbing network. The trial needs no pupil names or electronic sensors.

The principal risk is confusing a fall in municipal pressure with a blocked filter. The caretaker should therefore measure a nearby outdoor tap at the same time. If every tap slows together, local maintenance is unlikely to help. A labelled notice should tell pupils when a tap is closed, with another drinking point kept available. At the end of six weeks, consistent recovery at the cleaned tap would support extending the routine. Persistent brown water would end the experiment and require an appropriate water quality inspection before reuse.
