Riverton University invites teams to design a practical improvement for a small community institution. The institution has limited money, uncertain demand, and a responsibility to serve residents fairly. Your proposal should identify one operational problem, explain why existing practices are inadequate, and recommend an intervention that can be tested within one academic term. State the assumptions behind your analysis and explain which observations would cause you to change your recommendation. Include a way to measure progress without collecting unnecessary personal information. Discuss an implementation risk, a possible unintended consequence, and a low cost method for gathering feedback. The evaluation panel values clear reasoning over ambitious technology. Teams may use simple schedules, physical tools, or public information where appropriate. Do not assume that additional staff, permanent subsidies, or expensive equipment will become available. Conclude by explaining how the institution could decide whether to continue, adapt, or stop the proposed pilot after review.

My library proposal concerns lost shelf locations rather than late returns. Volunteers currently move donated books whenever a shelf fills, leaving the catalogue physically inaccurate. A set of removable coloured shelf cards would identify temporary overflow locations. A reader could find a moved title by consulting a single board beside the entrance. Each week a volunteer would sample twelve catalogue entries and count titles that can be found without asking for help.

The board could become another stale source of information. To prevent this, each shelf move should require moving its card before the books themselves. A second volunteer should check the board during opening preparations. Reader comments can be collected on anonymous slips, then discarded after tallying recurring problems. If retrieval time does not improve after two rotation cycles, the library should simplify its classification rules instead of purchasing more shelving. Large print labels would keep the physical system accessible to older visitors.
